

# HTML Introduction

## What is HTML?

HTML stands for HyperText Markup Language. It is the standard language used to create and structure web pages. HTML describes the structure of a web page using elements and tags.

## Why HTML is Important

HTML forms the backbone of all websites. It allows developers to structure content such as headings, paragraphs, images, links, tables, and forms.

## Basic Structure of HTML

An HTML document consists of elements like `<html>`, `<head>`, `<body>`, and `</html>`. These elements help organize content and metadata for browsers.

## Example of Simple HTML Code

```
<html>  
<head>  
<title>My Page</title>  
</head>  
<body>  
<h1>Hello World</h1>  
</body>  
</html>
```

## Conclusion

HTML is the foundation of web development. Learning HTML is the first step toward building modern websites and web applications.
